Abstract (Basic): WO 200421890 A1

NOVELTY - A disposable sterile container (1) attached to the child's uro genital for **collection** of uncontaminated **urine sample** has an opening (4) and (5). (5) Initially sealed by **water soluble adhesive substance** or **material** (9), which is **dissolved** by the fluid with in a moment and sets opened, preventing first portion of fluid reaching to (1).

DETAILED DESCRIPTION - The absorbing material (7), is surrounded by waterproof barrier and gives an anatomically shaped contour to fit wearer of both sexes, is placed from the urethral meatus to (5). (4) and (5) contains channel, that eliminates direct contact between wearers skin and the inside of (1). The device has been optionally integrated with a dipper.

USE - In **collecting** the uncontaminated **urine samples** from

small children.

ADVANTAGE - Diagnosis and treatment can be done quickly since samples collected are uncontaminated.

DESCRIPTION OF DRAWING(S) - The figure shows a view of sterile container.

Abstract (Basic): JP 5015549 A

Bag has a water-absorbing resin layer on the inside surface of a water-semipermeable bag body having an open end. The resin layer pref. contains a deodorant(s). Pref. an urine-passing material is provided on the inside surface of the resin layer. The bag body pref. has a fixing part to wear on the human body.

Water-absorbing resins include gluten, methyl vinyl ether-maleic acid copolymer, acrylic acid-vinyl alcohol copolymer, carboxycellulose-acrylic acid graft copolymer, polyvinyl pyrrolidone and crosslinked **carboxymethyl cellulose**. To achieve rapid absorption and gelling, the resin is pref. a mixt. of an anionic and a cationic resin(s). The deodorant is cysteine. The fixing part is typically a belt.

USE/ADVANTAGE - The resin layer absorbs urine rapidly to gel, without leakage. Even when a large amt. of urine is passed, the urine-passing material distributes the urine uniformly, improving the absorption efficiency. The bag can be worn on various parts of the

Patent Details:

Patent No	Kind	Lan	Pg	Main IPC	Filing Notes
GB 2162312	A		14		

Abstract (Basic): GB 2162312 B

The **urine collector** has an open-ended tubular body (11) and a cup (16) mounted, the cup having its open top equipped with a cover (18) that is formed at least in part of a **water - soluble material**. During use of the device, the cover initially deflects from the cup a stream of **urine** flowing through the **collector**. Within seconds the cover dissolves sufficiently to allow a subsequent uncontaminated portion of the stream to enter the cup.

A sample evacuation passage (25,225) extends from the cup and communicates, or is adapted to communicate, with a collection tube assembly which may take the form of an air-evacuated collection tube (29) with a piercable stopper (28) or a syringe with a retractable plunger. Pref. the cover is dome-shaped and the cup is provided with a framework of arched supporting struts to maintain the domed condition. (14pp Dwg.No.1/17

SE 8104698	A		10		

Abstract (Basic): SE 8104698 A

A container for **collecting urine** , encloses a capsule contg. a mixt. of gel forming components of cellulose. The contents can be made to contact the **collected urine** in a predetermined time.

Provides expendable **urine** container for **collection of urine** from incontinent people. Also it can be used to **collect urine** from a catheter connected to the bladder. The capsule is designed to be broken after the container is removed from the person, so as to gel the urine. (Provisional Basic previously advised in Week K12).

Urine testing appts. - has urine sampling part and judging part with sampling part detached from judging part after use.

Patent Assignee: DAINIPPON PRINTING CO LTD (NIPQ)

Number of Countries: 001 Number of Patents: 001

Patent Family:

Patent No	Kind	Date	Applicat No	Kind	Date	Week
JP 5340942	A	19931224	JP 92150918	A	19920610	199405 B

Priority Applications (No Type Date): JP 92150918 A 19920610

Patent Details:

Patent No	Kind	Lan	Pg	Main IPC	Filing Notes
JP 5340942	A		5	G01N-033/50	

Abstract (Basic): JP 5340942 A

In a **urine** testing appts. having a **urine sampling** part and a judging part, the **urine sampling** part is detached from the judging part after use.

The part to check wetting with **urine** is provided at the **urine sampling** part and is formed by e.g. an ink.

USE/ADVANTAGE - A part of the testing matter contacted directly with **urine**, i.e. the **urine sampling** part, is detached from the judging part after use. Also whether **urine** contacts the **urine sampling** parts or not is easily checked by the part of checking wetting with urine.

In an example, the urine testing matter is shown in the figure. (41) is a part of supporter (41') is another part of supporter, and (5) is the water absorbing matter held between (41) and (41'), (47) and (44) are windows for checking wetting with urine (43) is **window** for judging part. (51) is **water - soluble** cellulose (e.g. CD-2N) which is dissolved and collapsed in contact with water in urine and (52) is e.g. filter paper impregnated with analytical reagent(s). (46) of part (41) and (46) of part (41') are ditches which makes it possible to easily detach the part corresp. to **urine sampling** part (51) from the judging part corresp. to (52) by bending by hand after use. The **urine sampling** part is easily discarded by detecting and the judging part is conveniently stored or transported.

Designated States (Regional): BE CH DE FR GB IT LI NL SE

Abstract (Basic): AU 8433773 A

Device comprises a container, at least two water-soluble barriers, subdividing the container into at least three superposed chambers, and different biologically active substances in each chamber.

USE/ADVANTAGE - Upon introduction of an aq. biological **sample** to be tested into the topmost chamber, the **sample** successively mixes with the contents of the chambers, the contact time in each chamber being a function of the **water - solubility** of the barriers. If the **substances** in each chamber are so chosen that the colour or absence of colour in the final chamber indicates the presence or absence of a particular material in the test **sample**, that substance may be tested for. This provides a method for conducting immunochemical reactions in a self-contained sealed unit that requires only the addition of an unknown **sample** and water, and thus provides an assay system that is safe and accurate even when used by an individual who is not technically trained.

Abstract (Basic): EP 966936 A1

NOVELTY - The urine collector (10) comprises a bag (11) with an aperture (21) and flange (12). The **aperture** is a slit for **adhesive** attachment to the uro-genital area oriented in the longitudinal direction. The bag is a flexible receptacle to hold the discharged urine matter and ensures good contact between the flange and the skin.

USE - For urine management in babies, children or adults to be adhesively attached to the genital area.

ADVANTAGE - The collector minimizes the skin contact with the urine

through the aperture. The aperture is not chosen larger than necessary, which reduces the source of malodor and leakages. The design greatly help in placement of the device but also the handling. The bag entraps the material safely, sufficiently strong to withstand ruptures and pressures exerted on it.

DESCRIPTION OF DRAWING(S) - Figure of a perspective view of the urine management device.

Abstract (Basic): EP 966935 A1

NOVELTY - The urine collector (10) comprises a bag (11) with a flange (12) having multiple lobes (16), surrounding an **aperture** (13) with an **adhesive** attachment to the uro-genital area. The outer surface of the bag has patches of adhesives (40) to secure the bag to the abdomen. The aperture allows urine to be received from the body to a bag. Straps of a body-compatible pressure sensitive adhesive (20) is applied the wearer facing section of the flange.

USE - For providing increased comfort and satisfaction to the wearer while having a softer tactile feel.

ADVANTAGE - The urine collector has a hydrophobic layer enhancing the softness without adversely affecting the functionality. It is also more aesthetically pleasing with less crinkles during use and provides a high level of wearer and carer satisfaction to skin healthiness.

DESCRIPTION OF DRAWING(S) - Figure of a plan view of a disposable urine management device.

Abstract (Basic): EP 966934 A1

NOVELTY - The urine collector (10) comprises a bag (11) with a flange (12) surrounding an aperture (21). The bag is shaped to fit the uro-gentials of the wearer The flange, ensuring good contact, may be provided in any size and shape. The flange has facing section (22) and wearer facing section (23) that comprises a bulge beneath the **aperture** and a layer of **adhesive** . The flange it self is made of a soft, malleable material made of a hydrophobic material.

DETAILED DESCRIPTION - An INDEPENDENT CLAIM is also included for a method for a caretaker or a wearer for placing a urine management device.

USE - For use with babies, children or adults in holding bodily fluids

ADVANTAGE - The urine collector not only aids in placement but also assists in detachment and handling. The flange makes sure that urine does not come in contact with the perimeter surrounding the aperture protecting the wearer from skin irritations.

DESCRIPTION OF DRAWING(S) - Figure of a top plan view of the urine management device.

------------	---	--------------	----------------------------

DK 9701268	A	A61F-005/44	
------------	---	-------------	--

Abstract (Basic): WO 9923978 A1

NOVELTY - The urine collection bag(1) has front and rear walls formed of polymer **material** and with their edges **sealed** together. An inlet(5) transports **urine** into the **collection** bag and an outlet(7) empties the urine. The outlet comprises a siphon(17) and has an outlet valve(15) and the inlet and the outlet have a common lead-in in the bag.

DETAILED DESCRIPTION - the inlet and the outlet form a common tube communicating between the lowest point (18) of the bag and the point where the inlet is connected to the outlet. An INDEPENDENT CLAIM is included for an assembly joint for a urine collection bag.

USE - Esp. by people who are chair bound due to paralysis(e.g. tetraplegia, paraplegia, sclerosis and spina bifida.

ADVANTAGE - Is simple to produce and use without the risk of spillage.

DESCRIPTION OF DRAWING(S) - Illustrates the bag according to the invention.

Abstract (Basic): JP 11113946 A

NOVELTY - A long bag (1) made of soft elastic material, has opening corresponding to shape of perimeter of female urethral opening. The bag is made to bulge out wardly and the shape is retained by providing a shape retainer (7) along lateral inner surface of the bag. Perimeter of opening of the bag is provided with an elastic touch pad (2) with water proof property. DETAILED DESCRIPTION - The internal surface of the bag is lined with an urine absorbant pad (8). An urine collector (5) is formed at lower portion of the bag. A urine withdrawing pipe (6) is vertically insertive through an opening formed at top portion of the bag. An air introduction hole (9) is formed at top portion of the bag.

USE - Urine receiver for female patients. DESCRIPTION OF DRAWING(S) - The figure shows sectional view and front elevation view of the urine receiver. (1) Bag; (2) Touch pad; (5) Urine collector; (6) Urine withdrawing pipe; (7) Shape retainer; (8) Absorbant pad.

Patent No	Kind	Lan Pg	Main IPC	Filing Notes
DE 29814465	U1		6 A61F-013/15	

Abstract (Basic): DE 29814465 U

The nappy (1) has an internal central region (3) with waterproof flexible coating (5) facing the body. Inside this region an opening (5) is located near the outlet of the urinary tract. Through the opening, a pouch (7) of waterproof, flexible material extends towards the exterior. In the region of the opening, the pouch is sealed, water tight, onto the coating. Preferred variants for male and female infants are described.

USE - The nappy is used to collect a urine sample from small children.

ADVANTAGE - The nappy avoids possibly painful use of adhesives to make a seal, in **collecting the urine sample**.

Patent No	Kind	Lan	Pg	Main IPC	Filing Notes
SU 1117880	A1		3	A61F-005/442	

Abstract (Basic): SU 1117880 A

The collector consists of a container (1) with an inlet (2) and a drain port (3) covered by a moisture-resistant mesh. The container's walls are rigid and its inner chamber is filled with a moisture-absorbing granulated substance, e.g. polyvinyl formal foam. The inlet has an elastic seal (5) and a perforated partition (6) made from a moisture absorbing material with a pile facing towards the user.

During use the collector is pressed against the body and the urine passes through the partition to be absorbed by the material inside the container, while gases pass out through the drain port.

ADVANTAGE - Contains and absorbs urine in weightless conditions; can be employed while wearing space suit. Bul. 21/27.7.95

Abstract (Basic): DE 4236097 A

Device comprises a urine collecting bag made of waterproof, soft material and has (i) a waterproof, spin contacting surface (2) for covering a region extending from the mons pubis (21) to the perineum

(22) and in which there is a section with an **opening** (3) of highly elastic **material** facing the urine tube outlet; (ii) a urine draining chamber (12), arranged inside the **urine collecting** bag, with a **urine** outlet (15), separated from the opening (3) by a waterproof membrane (5) and separated from the skin contacting surface (2) by a membrane (11), (iii) hydrophobic particles (13) enclosed in the urine draining chamber and (iv) a space between the skin contacting surface (2) and the waterproof membrane (11).

ADVANTAGE - The device is simple and can be inserted and removed easily, and does not cause discomfort.

Patent Details:

Patent No	Kind	Lan Pg	Main IPC	Filing Notes
US 20060064033	A1	13	A61B-005/00	

Abstract (Basic): US 20060064033 A1

NOVELTY - A urination collection device comprises a collection funnel (100) discharging into a chamber (108) via a funnel outlet (104). The chamber has a tapered restriction point (124) or a valve at a distal end, and a port (112) located above the funnel outlet. The restriction point discharges to a reservoir (132). The apparatus includes a connecting tube (116) snugly fitting into the port, and at least one collection tube (120) connected to the chamber via the connecting tube.

DETAILED DESCRIPTION - The chamber is preferably transparent. The urination collection device further comprises a multidirectional stopcock (118) located between the connecting tube and the collection tube. The reservoir is selected from a bed pan, a toilet or a collection bag. The urination collection device is preferably constructed of a material that can be autoclaved.

USE - The device is useful for collecting a midstream portion of a urine discharge from a medical patient (claimed) having urinary tract infection, or undergoing chemotherapy or afflicted with chronic or debilitating illness; useful for urine collection of adult male and female patients, and geriatric and **pediatric** populations.

ADVANTAGE - The urine collection device provides sanitary and simple collection of mid-stream urine discharges from medical patients, without contamination and independent of an initial position of the urine discharge. The urination collection device can be reused after contamination with the urine sample. The collection chamber constructed of transparent material, allows direct observation of the accumulation of urine by the patient or medical practitioner.

DESCRIPTION OF DRAWING(S) - The figure shows a urine collection device.

- collection funnel (100)
- funnel outlet (104)
- chamber (108)
- port (112)
- connecting tube (116)
- stopcock (118)
- collection tube (120)

Patent Details:

Patent No	Kind	Lan	Pg	Main IPC	Filing Notes
US 20050101923	A1	38	A61F-005/44		

Abstract (Basic): US 20050101923 A1

NOVELTY - A male urinary incontinence device comprises a sheath non-permeable to urine, and includes a securement mechanism comprising a polymeric gel strip (22) and an elastic securement tape.

DETAILED DESCRIPTION - A male urinary incontinence device for attachment to the penis of an individual for receiving urine and delivering the urine to a collection chamber comprising a sheath non-permeable to urine, the being cylindrically shaped when fully applied to the penis, and comprises a first opening sized to receive a portion of the length of the penis and a second end spaced from the first end including a hollow connector, the hollow connector attached to the collection chamber, the distance between the first end and the second end being sufficient to enclose at least the glans of the penis, and carry securement mechanism on the interior and exterior surface at the first end, the securement mechanism comprising a polymeric gel strip and an elastic securement tape, the sheath having an upper surface with an opening extending longitudinally from the first open end at least a portion of the distance between the first and the second ends, the polymeric gel strip adhesively attached to an upper circumferential portion of the inner surface of the sheath adjacent the first end opening of the sheath, the gel strip comprising a polymeric gel material impervious to urine, having a skin contact surface which provides adhesion to the skin surface of the penis but is readily removable without leaving residual gel material on the surface of the penis, the gel material being stretchable and contractible after application to the penis to an extent similar to changes in circumference or length of the penis after application without

compromising adhesion to the sheath or penile skin surface or allowing urine leakage, the gel strip skin contact surface having a removable barrier material covering the contact surface, the barrier removable during placement of the sheath on the penis, the elastic securement tape having a first end attached to an upper circumferential portion of the outer surface of the sheath adjacent the first end opening of the sheath, the tape oriented to be wrapped circumferentially around the sheath, the securement tape having attachment mechanism extending along the length of its inner surface so that upon wrapping the tape around the upper circumferential surface of the sheath the tape becomes adhered to the sheath, secures the sheath to the penis placed and closes the opening extending longitudinally from the first open end at a portion of the distance between the first end at least a portion of the distance between the first end and the second end in a leak proof manner.

An INDEPENDENT CLAIM is also included for a method of applying a urine collection sheath to the penis of an individual comprising:

- (1) providing a cylindrical sheath;
- (2) placing the penis in the sheath with the glans of the penis located within the sheath between the barrier covered polymeric gel strip and the sheath second end;
- (3) grasping both pieces of barrier material at a point farthest removed from the opening extending longitudinally from the first open end and simultaneously removing the pieces of barrier material while applying an upward force on the sheath against a penile shaft, causing the left and right halves of the gel strip to contact and adhere to the skin surface of the penis; and
- (4) wrapping the securement tape circumferentially around the outer surface of the sheath.

USE - The invention is used for attachment to the penis of an individual for receiving urine and delivering the urine to a collection chamber. It is for incontinent males.

ADVANTAGE - The invention permits an individual or caregiver to easily place the device on any sized male member without the need for the application of any force to stretch or deform the device while applying it, even if the penis is flaccid and withdrawn. It provides a positive seal while generally isolating the external penile tissue and surrounding skin from prolonged contact with urine.

DESCRIPTION OF DRAWING(S) - The figure shows an isometric view of the male urinary incontinence device.

Patent Details:

Patent No	Kind	Lan Pg	Main IPC	Filing Notes
US 20040215105	A1		8 A61B-005/00	

Abstract (Basic): US 20040215105 A1

NOVELTY - The shield (10) has a shaped cover with slides forming an outwardly projecting portion into a tent-like enclosure. The slides include a bottom edge and are spaced apart from one another. Wing units extending from the slides spreads apart to cause a top edge of the cover to project outward from a bottom edge at a sufficient distance. An adhesive on the wing units secures the cover to human body to deflect a stream of urine.

USE - Used over genitalia of male infant, children or adult to deflect urine downward during transport, examination, and treatment and to facilitate collection of urine for healthcare purpose.

ADVANTAGE - The shield effectively reduces the likelihood of a person or healthcare worker being sprayed by urine. The shield improves the ability of healthcare workers to collect and monitor urine discharged by a patient. The adhesive on the wing unit effectively holds the deflector in position on the patients body above the genitalia and prevents it from being easily knocked out of place or being displaced by the flow of urine from the patient. The shield is relatively inexpensive to make and easy to use.

DESCRIPTION OF DRAWING(S) - The drawing shows a top plan view of a urine deflector shield.

Abstract (Basic): WO 200174275 A1

NOVELTY - A receptor (1B) for receiving urine, has surface

extending from a rim (5B) which contact with user's body. A tubular portion (3) extends from the surface. A coupling (60A) is formed along the tubular portion for connecting sample collection container (70).

DETAILED DESCRIPTION - A receptor (1B) for receiving urine, has surface extending from a rim (5B) which contact with user's body. A tubular portion (3) extends from the surface. A coupling (60A) is formed along the tubular portion for connecting sample collection container (70).

The end of the tubular portion is closed except an excess overflow outlet. The coupling is directed away from the axis of the tubular portion at a fixed angle other than a right angle. The rim and surface of the receptor form a shovel like shape

USE - For urine collection in testing for legal or medical reasons, for waste urine collection from toilets and for facilitating urination of women, handicapped, aged, etc. The medical applications includes detection of protein bladder infections, drugs, hormones, proteins, pregnancy fetal conditions or abnormality or fetal diseases etc. It is also used in testing glucose, bilirubin, ketone, specific gravity, blood, pH, protein, urobilinogen, nitrite, leukocytes. The legal reasons include assisting of police in investigating drink drive, drug abuse, DNA testing, rape allegations for sports events, military health check-up, etc.

ADVANTAGE - The rim and receptor surface form a shovel shape which perfectly fit with the user's body which reduces the likelihood of contamination of the user's hand. The collected urine is directly taken for testing without transferring into another device. Bed-ridden and disabled people comfortably urinate. Facilitates the collection of urine samples from **children**, pregnant women, women with broken legs, the obese, etc.

DESCRIPTION OF DRAWING(S) - The figure shows the top plan view of urine sample collection apparatus.

Abstract (Basic): WO 200049948 A2

NOVELTY - A urine sampling patch comprising a urine permeable membrane covering an upper surface of an absorbent material and a water proof backing covering a lower surface of the material, is new.

DETAILED DESCRIPTION - INDEPENDENT CLAIMS are also included for the following:

- (1) a test detecting the presence of lactose in urine; and
- (2) a screening test for vitamin A deficiency using the test of (1).

USE - For collecting urine samples to test for vitamin A deficiency in **babies** (claimed). The patch can also be used to **collect urine** from mentally challenged patients, and to test for blood, protein or sugar in **babies** urine, and allow screening for biliary atresia, urinary tract infections, coeliac disease and cow's milk protein intolerance.

ADVANTAGE - The collector does not have to be attached to the patient.

DESCRIPTION OF DRAWING(S) - The figure shows a urine sampling patch.

- Test strip (5)
 - Reagent areas (6)
 - Strings (7)
 - Upper closure strip (8).

Abstract (Basic): GB 2333755 A

NOVELTY - The portable collection device has a urine receptacle with a base and an upstanding perimeter wall extending away from the base to a constricted neck portion (5). The device has an adaptor (8) with a throat portion and a mouth portion, which has a greater cross section than the throat portion to define a funnel. The neck portion is threaded to receive a threaded cap to seal the device.

USE - The device is designed to be used to collect urine, either for medical samples or for use in the absence of a toilet, such as when camping, sailing or traveling, particularly for use with small children .

ADVANTAGE - The device is small and easily portable. The funnel connects to the neck when in use and fits around the outer perimeter wall of the container when being stored. The device is reusable and watertight. The mouth portion of the device is ergonomically designed to be easily usable by females.

DESCRIPTION OF DRAWING(S) - The drawing shows a side view of the urine collection device in a ready to use configuration.

 AU 9726480 A A61F-005/44 Based on patent WO 9851243

Abstract (Basic): WO 9851243 A

The collector includes a concave waterproof container body whose shape, volume, and surface are suitable for holding in opening (2a) of its concave part (2) the external genitals of the small patient. It is equipped over at least a portion of its outer edge (2c) with a cuff (3) which is connected to its walls according to predetermined slopes (alpha, beta). A concave part and cuff are shaped in such a way as to fit ergonomically between the inside joints of the thighs, thus being secured in place.

A filler made of sterile absorbent material (4) that can tamp the concave part to a predetermined extent. The opening (2a) of concave part is partly blocked by a septum that is preferably located toward the perineal area. The opening of concave part is closed by a basically sealed waterproof membrane (5) that it is able to adhere to the outer surface of the flat cuff (3) and to be removed before collector (1) is attached.

ADVANTAGE - Can be used by anyone and which, by virtue of its design, proves to be reliable and easy to use.

US 5622183	A		9	A61B-005/00	CIP of application US 93149549

Abstract (Basic): US 5622183 A

The device includes an elongated flexible tubular conduit member. The conduit member has a funnel-shaped opening at one end to be in sealing relationship with a urethra or glans penis and a discharge end to be received within a sample container.

The sample container includes an opening with a sealing member to receive the discharge end of the elongated flexible tubular conduit member in an open position for receiving a urine specimen in it and in a closed position when the discharge end of the elongated flexible tubular conduit member is withdrawn.

USE/ADVANTAGE - For collecting uncontaminated liquid specimens, particularly, urine specimens from adult females, adult males and **paediatric** males. Reduces number of contaminated **urine samples** obtained from adult females, adult uncircumcised males and **paediatric** males and subsequently decreasing contamination of samples.

Abstract (Basic): US 5511557 A

The device comprises an elongated flexible tubular conduit having a funnel-shaped first opening at one end and a second opening at the opposite end. The funnel-shaped opening being sized to fit around the outer periphery of a glans penis and to form a seal about it. The tubular conduit member includes fastening tabs on it for attaching the tubular conduit member to a glans penis.

There is a sample collector having an opening in it, and a closure member disposed within the opening of the sample collector. The closure member having member to receive the opposite end of the tubular conduit through it. The member to receive the opposite end of the tubular conduit including sealing member when not in receipt of the opposite end in it.

ADVANTAGE - Provides an apparatus for the collection of urine samples which reduces the number of contaminated urine sample obtained from adult females, adult uncircumcised males and **paediatric** males and subsequent decreasing contamination of the samples. Reduces the number of patients being treated unnecessarily for urinary tract infections due to contaminated **urine specimen**.

Abstract (Basic): SU 906559 A

The device for collecting urine from young **children** has a urine receiver composed of two chambers (1,2). The reception chamber (1) is made in the form of a truncated ellipsoid, and the chambers are joined to each other by a junction ring (3) with diameter less than that of the chambers, which prevents urine flowing back into reception chamber (1).

The edges of chamber (1) have a sealing rim (4) and apertures (5) for fixation of the device on the body. Chamber (2) is joined by pipe (6) and flexible tube (7) to a urine container.

When the device is fitted the intake aperture should be in close contact with the body, going round the penis without the scrotum in boys and around the urethra and labia minores in girls.

ADVANTAGE - Prevents intertrigo when collecting urine from very young **children** . Bul.7/23.2.82 (2pp Dwg.No.1/1)

ABSTRACT: This invention relates to a urine management device (10) comprising a bag (11) and a flange (12). The flange (12) comprises adhesive (20) used to attach the device (10) to the uro-genital area of the wearer. The invention resides principally in providing an optimised shape of the aperture (21) of said device (10). One preferred embodiment of the invention is an aperture (21) whose contour is defined by one ellipse in the longitudinal direction, the longitudinal diameter of said ellipse being 2.25 times greater than the transversal diameter.

ABSTRACT: A **urine collection** cup device is provided including a clear plastic cup, a reagent strip disposed against an inner surface of the cup and adhered thereto by means of a plastic laminate or **adhesive** member.

An **aperture** is provided in the **adhesive** member on a sample introduction end of the reagent strip to enable a fluid sample to be introduced onto the reagent strip. By capillary action the fluid migrates up the reagent strip and causes a visible indication of test validity and test results. A second **aperture** covered with a hydrophobic **material** is provided adjacent the reagent strip end to enable air to vent from the strip while preventing fluid specimen from entering therein.

ABSTRACT: A **urine specimen** cup with a cup portion and a lid portion mountable on the cup portion in a sealing relationship. The lid portion has walls defining an aperture therethrough and a flexible tab is mounted on the lid portion to cover the aperture and also extend over the rim of the lid portion to engage the cup portion. The first section of the tab which overlies the **aperture** is provided with a resealable **adhesive** to allow repeated lifting of the first section to provide access to the **urine specimen** in the cup and then be resealed. The second section of the tab has a permanent adhesive so that once adhered it provides a permanent seal between the cup and lid to insure integrity of the sample. A tear line is provided between the first and second sections of the tab to allow ultimate removal of the lid from the cup for disposal of the specimen.

A **urine collection** device for females is described. It is comprised of a **collection** element defining a **urine collection** chamber and an inlet opening into the chamber and is adapted to be disposed in surrounding relation to the urethral opening of the user. A drainage conduit is connected to the collection element in communication with the chamber whereby the chamber and conduit together comprise a urine flow pathway for carrying urine generally away from the **inlet**. A first body of wicking **material** is mounted adjacent the collection element and extends at least partially into the flow pathway. The device preferably also comprise a vaginal insert element including a seal portion for preventing the entry of urine into the vagina.

A **urine collection** device for females comprising an interface body with a surface for engagement with the user's body is described. The interface body is composed of a forward portion defining a urine-receiving bore with an inlet in the interface surface adapted to the urethral opening of the user, and a rear portion integrally adjoining the forward portion with a noninvasive vaginal seal on the interface surface. A removable absorbent pad is supported on the interface body and is extended laterally. A garment is provided for supporting the **urine collection** device.

Abstract (Basic): WO 200421890 A1

NOVELTY - A disposable sterile container (1) attached to the child's uro genital for collection of uncontaminated urine sample has an opening (4) and (5). (5) Initially sealed by water soluble adhesive substance or material (9), which is dissolved by the fluid with in a moment and sets opened, preventing first portion of fluid reaching to (1).

DETAILED DESCRIPTION - The absorbing material (7), is surrounded by waterproof barrier and gives an anatomically shaped contour to fit wearer of both sexes, is placed from the urethral meatus to (5). (4) and (5) contains channel, that eliminates direct contact between wearers skin and the inside of (1). The device has been optionally integrated with a dipper.

USE - In collecting the uncontaminated urine samples from small children.

ADVANTAGE - Diagnosis and treatment can be done quickly since samples collected are uncontaminated.

DESCRIPTION OF DRAWING(S) - The figure shows a view of sterile container.
